Kassidy Zastrow

ABOUT

Growing up in the DFW area surrounded by high rise buildings, expansive highway systems, and large scale developments, I was drawn to art and design from an early age. My path toward architecture began in elementary school after completing a drawing of a building that led my art teacher to ask if I had ever considered becoming an architect. As I grew older, my dad's work in plastic molding and engineering introduced me to another side of design through technical problem solving and understanding how ideas can be developed into something tangible. After exploring architecture further through courses in high school, I knew it was the path I wanted to pursue. I am now a junior in the Bachelor of Science in Architecture program at Texas A&M University, where I continue to develop my skills in design thinking, modeling, spacial analysis and visual communication. As I pursue an internship, I am excited to apply these skills in a professional environment, contribute to real world projects, and continue growing as a designer and future architect.

EDUCATION

Texas A&M University - Bachelor of Science in Architecture

Expected Graduation: 2028

TECHNICAL SKILLS / DESIGN EXPERIENCE

Revit - Advanced

- Revit Certification
- 3D modeling, plan sets, elevations, sections
- Family editing
- BIMObject and Turbosquid component integration
- Exterior development and site modeling
- Sheet organization and rendering
- Presentations, critiques, group work

Rhino - Advanced

- 3D modeling, plan sets, elevations, sections
- Turbosquid component integration
- Exterior development and site modeling
- Sheet organization and rendering
- Physical Model making
- Presentations, critiques, group work

Sketchup - Intermediate

- 3D modeling, plan sets, elevations, sections
- Exterior development and site modeling
- Sheet organization
- Physical Model making
- Presentations, critiques, group work

Autocad - Intermediate

- Drawings, plan sets, elevations, sections

Adobe Photoshop - Intermediate

- Shading, editing, AI integration

Adobe InDesign- Intermediate

- Organized work

Adobe Firefly - Intermediate

- Created AI renders

Adobe Lightroom - Intermediate

- Edited drawings

Adobe Express - Intermediate

- Edited photos

FIELD EXPOSURE

Residential Construction Site Observation

- Observed framed residential construction across multiple active projects
- Studied structural framing systems and construction sequencing
- Gained understanding of coordination between architectural drawings and field execution
- Spoke to professionals about mistakes commonly seen in the translation between Architecture and Construction

LEADERSHIP & PROFESSIONAL EXPERIENCE

Dogs Unleashed Daycare — Kennel Tech

2025-2026

YMCA, Bedford — Program Lead

2024

Standard Insurance —Office Assistant

2024

Senior Lieutenant —Drill Team Dance Officer

2023-2024

ORGANIZATIONS

ACE - Architecture, Construction, Engineering Club

Alpha Omicron Pi - Sorority

AWARDS

Award of Excellence in CTE Business & Industry

Bridge Stability Competition Winner - ACE

College Board National Hispanic Recognition Scholar

COMMUNITY SERVICE

Big Event

Talk About the Troops

Spike out Arthritis

Arbor Daze

Painting for Elementary Kids

LUMEN

RESIDENTIAL HOUSING

Lumen is a contemporary residential project which explores the relationship between light, material, and the connection between indoor and outdoor living. Warm wood and stone masonry are contrasted with large areas of glazing, allowing the home to transform throughout the day. Asymmetrical roof forms, a curved dining area, balconies, and outdoor gathering spaces create special moments throughout the residence while maintaining a connection with the surrounding landscape. This project emphasizes atmosphere and the experience of living in a modern space that still feels warm and comfortable. Lighting elements are used as a defining piece of the home's architectural identity.

Forested Area

WAVE APARTMENTS

LARGE SCALE RESIDENCES

Wave Apartments is a coastal residential project designed with the intention of creating a connected community within a large apartment complex. This project includes both standard residential and penthouse units. It combines residences with shared spaces such as work areas, indoor and outdoor seating, fitness facilities, and a rooftop pool overlooking the surrounding environment. A sky bridge connects the two parts of the complex while stairs and elevators provide circulation throughout each side of the building. Coastal influences are incorporated throughout the design with brown concrete, garage walls shaped like waves, and fish graphics along the exterior, giving the project a fresh and playful identity that connects the architecture to its setting.

THE HIVE BATHS

BATH HOUSE

The Hive Baths implements a past, present, and futuristic exploration of the traditional bathhouse as a community and social space. The project utilizes hexagons as the primary language which guides the form, circulation, and program. This project was inspired by the Trenton Bath House by Louis Kahn and the geometry of a beehive with elements of 1980s futurism. The structure appears to peel away, unrolling down the hillside creating a series of spaces for hot baths, steam rooms, and a garden room. The three dimensional form creates unique relationships throughout the project. The central Atrium's skylight creates an expanding hexagonal light that shines on the pool below. The observation tower allows visitors to look into the central atrium from the balcony. Circulation occurs above and below the structure, allowing visitors to experience the bath house from different elevations and perspectives. The Hive Baths explored geometry, movement, light, and shared spaces and our small team gave us the creative freedom to experiment with these ideas and develop a unique architectural identity for the project.

IRRADIATION ILLUSION

FRAMING DOMESTIC VIEWS

Project 1 explores the redesign of my bedroom within my sorority house through the use of spatial illusion, light materiality, and vertical expansion. Rather than significantly increasing the physical footprint of the room, the design focuses on creating the perception of a larger, brighter, and less cluttered space through strategic organization, natural light, and material choices. Vertical expansion through elevated sleeping areas creates additional openness while also transforming the experience of entering and occupying the room. This project investigates how thoughtful residential design can maximize limited living spaces and respond to the growing need for efficient housing solutions in the future.

GATEWAY LIVING

FRAMING INFILL HOUSING

This project focuses on the transformation of an existing neighborhood through the introduction of a cohesive architectural typology, increased density, and structured community planning. The design centers around a large apartment complex that frames the primary gateway entrance into the neighborhood while additional gateway elements guide movement throughout the site. The neighborhood is organized into three distinct spatial zones consisting of public, semi private, and private areas, creating a gradual transition between community interaction and residential privacy. Public spaces run through the center of the neighborhood, while semi private and private zones extend outward to support both connectivity and comfort for residents. This project explores how urban density and consistent architectural language can reshape an existing neighborhood while maintaining a balance between large scale development and residential living.
